

# Doküman

---

Doküman is a web server that can convert your Markdown into PDF files — useful for producing decent looking API docs and more.

## API

---

`POST /api/pdf` converts Markdown to a PDF file.

## Parameters

- `markdown` (required): the Markdown content.
- `title` (optional): title of HTML page.

## Run

---

A Vagrantfile is included in this repo and probably provides the easiest way to get the server up and running. Start server from Vagrant box:

```
vagrant up
vagrant ssh
cd /vagrant
nvm install
npm install
node app.js
```

Now we are ready to use the server:

```
# From your local machine
curl --data-urlencode "markdown@./README.md" \
  http://localhost:8080/api/pdf > README.pdf
```
